INFSCI 2560 Personal Growth Report 2

Zhixiang Liu   peoplesoft：4301037

In this assignment, I start building my personal site based on actual framework that is used in many web. Bootstrap is very easy to use, it provide default layout that makes me easy to organize my elements and it looks great, also some default elements such as button, form, and icons, save lots of trouble designing the style.

I am also able to implement some simple but nice application using Javascript, like I did in calculator, if I develop it in other language, I have to spend lots of time on building interface, but with bootstrap, I don't need to worry too much on that and I can focus more on the functional codes, and I finally developed that application with about 50 lines Javascript. Likewise, other pretty application could be done using framework, therefore, I'd like to explore more fun stuff in the further assignment.

So far we didn't use any of libraries in design, and when I search for the existing wed site with amazing effect, it always use those libraries like jQuery. I hope I can fully use those libraries as soon as possible so that my personal site would become more attractive and interactive. Meanwhile, I would search for more example of Javascript and hopefully apply to my future design, learn more about back-end and be able to use in the final project.
